

COOLSCULPTING® VS EMERALD LASER™

CoolSculpting® works by freezing and killing your fat cells.

Your fat cells are a vital part of your endocrine system, and the last thing you want to do is kill them. Treatments that kill fat cells harm your metabolic system and decrease your natural metabolism, opening the door to progressively more vicious cycles of weight gain.

Additionally, CoolSculpting® has many reported adverse side effects including:

- Redness, bruising, and swelling
- Tenderness, cramping, and aching
- Late-onset pain
- Freeze burn (“frostbite”)
- Necrosis (cell death)
- Paradoxical hyperplasia (gradual development of a visibly enlarged tissue volume)
- Hernia

Emerald Laser™ works by healing your fat cells.

Excess weight is a sign that the fat cells in your body have become sick and bloated. Emerald Laser™ opens up microscopic pores in your fat cells to release the accumulated excess fatty acids. Once released into your body, these fatty acids are used for energy or drained through your lymphatic system and removed as waste. The microscopic pores in your fat cells repair themselves and close back up within 72 hours of therapy, leaving healthy cells that have been drained of their excess fat. As fat cells release their excess material, they naturally begin to heal and reduce back down to their natural size.

Emerald Laser™ has had zero reported side effects or adverse events.
